

WDP - Assignment 5: Relations and Normalization

If you get stuck, refer back to the lecture notes on how to complete the following tasks.

1. Download **MySQL** to your computer. If you want to use an online service instead, that is fine. You will just need to find out the hosting information.
2. Create the **database** that you will use for your project.
3. Using your ERD, create your relations using a data modeling tool, such as [LucidChart](#).
 - Determine if your relations are in 1NF, 2NF and 3NF. If not, update your relations so they are.
4. From your relations, create the tables for **at least two** connected entities. Example: User and Recipe, User and Post, etc. Create a file called **tables.sql** containing the code used to create each table. Add it to your project folder.
5. Add your ERD and relations to your README.md (You can take a screenshot of each and add them as an image in the file). Include a short description before each image explaining what each diagram is and its purpose in database design.
 - Markdown Reference: <https://www.markdownguide.org/basic-syntax/>
6. Commit your changes to Git and push your changes to GitHub.
7. Submit the GitHub repo link of your project.
